Contents

1 StartScreen

Author: Steven Dellamore
Description: Startscreen will build the startscreen and create all the buttons needed for the user to get into a game with their friends. The mouseClicks and the keyboard imports all all forwarded to this class when gamestate == 0

1.1 constructor

Author: Steven Dellamore

constructor()

Description: The constructor gets called when making a startscreen object. It will init all the values and set up the socket listener for the server to send things too. Here are the init values of the class variables:

```
this.TokenBoxText = "";
this.usernameBoxStroke = false;
this.usernameText = "username";
this.usernameTextTouched = false;
this.gameStateStartScreen = 0;
this.titleAnimation = [300, 500, 400, 700];
```

These varibles will be updated throughout the life of start screen. `this.TokenBoxText` will init the token box to nothing, since the user has yet to do anyhting. the `this.usernameBoxStroke` will be set to false so the program knows if the user as tried to sumbit. `this.titleAnimation = [300, 500, 400, 700];` is the starting position of the title, and will fall every X frames.

Parameters:
void : constructor takes no params

Returns:
StartScreen : An object of start class class

1.2 draw

Author: Steven Dellamore

draw ( )

Description: This funcion will be ran at 60 frames a second and will call all the functions needed to draw the launch screen. The draw function will call the title functions, the highscore functions, and call the join and create button rendering/hitboxes with `Buttonloop()`. Depending on what `this.gameStateStartScreen` is evaluated to.

```
switch (this.gameStateStartScreen) {
        case 0:
                this.drawUsernameBox();
                break;
        case 1:
                this.drawTokenBox();
                break;
}
```

Parameters:
void : draw takes no arugments

Returns:
void : void

1.3 animateTitle

Author: Steven Dellamore

animateTitle ( )

Description: Will check and add/subtract the locations of the T's falling when you go to the launch screen.

```
if (this.titleAnimation[i] > 0) {
        this.titleAnimation[i] -= 10;
}
```

Once `this.titleAnimation[i]`, where `i` is between `[0,4]`, is negative, the array index will no longer be decremented.

Parameters:
void : animateTitle takes no arugments

Returns:
void

1.4 drawUsernameBox

Author: Steven Dellamore

drawUsernameBox()

Description: This function will draw the white username box onto the screen displaying the `this.usernameText` in the center. This function will also use `this.usernameBoxStroke` to display the red outline around the username box.

Parameters:
void : drawUsernameBox takes no arugments

Returns:
void

1.5 drawTitle

Author: Steven Dellamore

drawTitle()

Description: This function will draw the title (Teamtris) onto the launch screen. Also, the function will be responable for displaying the current falling location of the two T's falling at the start of the screen. We make rects based on the current location of `this.titleAnimation`.

```
let yStart;
rect(-windowWidth / 4.3, (yStart = windowHeight / 2.6) -
                this.titleAnimation[0], squareSize, squareSize)

rect(-windowWidth / 4.3, (yStart - (spaceBetweenSquares)) -
                this.titleAnimation[0], squareSize, squareSize)

fill(255, 0, 0) // fill red

rect(-windowWidth / 4.3, yStart - (2 * spaceBetweenSquares) -
                this.titleAnimation[1], squareSize, squareSize)

rect(-windowWidth / 4.3 - spaceBetweenSquares,
                yStart - (2 * spaceBetweenSquares) - this.titleAnimation[1],
                                squareSize, squareSize)

rect(-windowWidth / 4.3 + spaceBetweenSquares,
                yStart - (2 * spaceBetweenSquares) - this.titleAnimation[1],
                                squareSize, squareSize)
```

The important thing to note is to see the y val of the rect is being changed by 10 every frame in `function animateTitle()`.

Parameters:
void : drawTitle takes no arugments

Returns:
void

1.6 drawTokenBox

Author: Steven Dellamore

drawTokenBox ( )

Description: This function will draw the token box once the user clicks "join game". It will display the token box and the accept button. Unlike other buttons, all mouse clicks are handled.

Parameters:
void : drawTokenBox takes no arugments

Returns:
void

1.7 mouseClickedStart

Author: Steven Dellamore

mouseClickedStart()

Description: This function is being called whenever `gamestate = 0` AND the user clicks their mouse. First, we will check what `this.gameStateStartScreen` is. If its `0`, we will check the `function ClickedLoop()` to see if the user is clicking on the join game, create game, or highscore score buttons. If the user clicks on a the create game button with a valid username we are going to send them into the lobbyscreen.

```
// Creating my lobbyscreen object
mLobbyScreen = new LobbyScreen(
        new Player(
                this.usernameText, Math.floor(Math.random() * 100), true));

gameState = 1; // Switch to lobby screen
```

We need to create a new Player, and set their ownership value to 0. We see its constructor defined here:

```
constructor(username, id, owner){
    this.username = username;
    this.id = id;
    this.owner = owner;
    this.playerNum;
}
```

We then pass this object into the lobbyscreen and switch the `gameState = 1` to move the user to the next screen.

Parameters:
void : mouseClickedStart takes no arugments

Returns:
void

1.8 drawHighScoreButtonCheckMouse

Author: Steven Dellamore

drawHighScoreButtonCheckMouse()

Description: This function is being called whenever the user clicks with gamestate of the `this.gameStateStartScreen == 0;`. This function checks if the mouse is over the highscore button and returns `true` if it is, `false` if its not.

Parameters:
void : drawHighScoreButtonCheckMouse takes no arugments

Returns:
bool :
true => If mouse is over score button
false => If mouse is not over score button

1.9 drawHighScoreButton

Author: Steven Dellamore

drawHighScoreButton()

Description: This function will draw the three bars in the bottom left of the screen. It will first check what `this.drawHighScoreButtonCheckMouse()` and set accordingly:

```
let fillHighScore = "white"; // default value is white
/* Checks if the mouse is over the highscore */
if (this.drawHighScoreButtonCheckMouse()) {
        /* if the mouse is over, it will change the boxes to green */
        fillHighScore = "rgb(0,255,0)";
}
```

If `this.drawHighScoreButtonCheckMouse()` returns true, then we set `fillHighScore` to `"green"`, otherwise keep it `"white"`.

Parameters:
void : takes no arugments

Returns:
void : no return

1.10 keyPressedStart

Author: Steven Dellamore

keyPressedStart()

Description: Called whenever the `General::function keyPressed()` function routes the signal to this function. a.k.a whenver `gameState == 0`. This function first checks the `this.gameStateStartScreen` like so:

```
switch(this.gameStateStartScreen) {
    case 0:
        // username box active
        ...
    case 1:
        // token box active
        ...
}
```

From here, we can figure out where the user is trying to type and add the types characters accoridngly.

Parameters:
void : keyPressedStart takes no arugments

Returns:
void

2 Player

Author: Steven Dellamore, Richard Hansen
Description: Every user will have their own object of the Player class. This

is going to be passed around to other people in the lobby. This class will tell the game screen who is who and will help identify moves.

2.1 constructor

Author: Steven Dellamore

```
constructor(username, id, owner)
```

Description: The constructor takes in three things, a name, id and a owner flag. It will then create an object of `Player` and init all class varibles. This Class is used throughout all stages of the program.

Parameters:
String username : username of the new Player
int id : id, `[0,4]`, of the new player.
boolean owner : `true` or `false` if they are owner

Returns:
Player : An object of Player class

2.2 setPlayerNum

Author: Steven Dellamore

```
setPlayerNum(num)
```

Description: Will set `this.playerNum` equal to `num`. This is just a helper function.

Parameters:
int num : sets the `this.playerNum = num`

Returns:
void : returns nothing

3 Team

Author: Steven Dellamore, Richard Hansen
Description: The team class will contain all the other players that are in your game, the team name and the token for your lobby. Once new players come addPlayer will be called to push a newplayer onto the playersInTeam array.

3.1 constructor

Author: Steven Dellamore

```
constructor()
```

Description: The constructor gets called anytime someone joins or create a game.

Parameters:
void: no parameters

Returns:
Team : A object of the class

3.2 addPlayer

Author: Steven Dellamore

```
addPlayer(player)
```

Description: The add player function gets called whenever a bot or a real player joins your lobby. This function will also be called to populate the lobby when you join.

Parameters:
Player player: This parameter is the new player/bot that is joining your

team.

Returns:
void : no return

4 General

Author: Steven Dellamore, Richard Hansen
Description: This is an abstract class that will hold mouseClicked and keyPressed p5 functions.

4.1 mouseClicked

Author: Steven Dellamore, Richard Hansen

mouseClicked()

Description: Will be called whenever the user clicks on anywhere on the screen. Once called, it will go straight into a switch to decide where to route to based on the gameState

```
switch (gameState) {
    case 0:
        // start screens mouseClicked
        mStartScreen.mouseClickedStart();
        break;
    case 1:
        // lobby screens mouseClicked
        mLobbyScreen.mouseClickedLobby();
        break;
    case 2:
        break;
    case 3:
        break;
}
```

The varibles `gameState`, `mStartScreen`, `mLobbyScreen` are all defined in sketch.js

Parameters:

void : takes no parameters

Returns:
void : returns nothing

4.2 keyPressed

Author: Steven Dellamore, Richard Hansen

mouseClicked()

Description: Will be called whenever the presses a key. Once called, it will go straight into a switch to decide where to route to based on the gameState

```
switch (gameState) {
  case 0:
    mStartScreen.keyPressedStart();
    break;
  case 1:
    mLobbyScreen.keyPressedLobby();
    break;
  case 2:
    mGameScreen.keyPressedGame();
    break;
  case 3:
    // mScoreScreen.keyPressedScore();
    break;
}
```

The varibles `gameState`, `mStartScreen`, `mLobbyScreen` are all defined in sketch.js

Parameters:
void : takes no parameters

Returns:
void : returns nothing

5 SingleBot

Author: JavaComSci
Description: Single bot extends the abstract bot class defined here:

```
public abstract class Bot {
    public abstract List<Tuple<int, int>> GetMove(
        Board board,
        List<Block> blocks,
        bool allRotations = false
    );
}
```

The SingleBot class will be made if the player requires only one bot in their game.

5.1 SingleBot

Author: JavaComSci

SingleBot()

Description: Creates a new board for the bot.

Parameters:
void : SingleBot takes no params

Returns:
SingleBot : An object of single bot class

5.2 getFit

Author: JavaComSci

List<...> getFit(Board board, Block block, int rotation)

Description: need desc here TODO

Parameters:
Board board : contains the the board that we want to make the move on
Block block : contains the block that we want to fit
int rotation : which roation we are trying to fit for

Returns:
List<...> compatiblePieces : information about the pieces that are compatible on the board

5.3 GetMove

Author: JavaComSci

```
public override List<...> GetMove(Board, List<Block>, bool)
```

Description: need desc here TODO

Parameters:
int[][] board : current enviornment
List<Block> blocks : contains the list of all the blocks to try to fit in this location

Returns:
List<...> bestPiecePlacementOfCurrentBlock : contains the list of the indicies of where the piece would be on the board

6 DoubleBot

Author: JavaComSci
Description: DoubleBot bot extends the abstract bot class defined here:

```
public abstract class Bot {
    public abstract List<Tuple<int, int>> GetMove(
        Board board,
        List<Block> blocks,
        bool allRotations = false
```

```
    );
}
```

The DoubleBot class will be made if the player requires two bots in their game.

7 TripleBot

Author: JavaComSci
Description: TripleBot extends the abstract bot class defined here:

```
public abstract class Bot {
    public abstract List<Tuple<int, int>> GetMove(
        Board board,
        List<Block> blocks,
        bool allRotations = false
    );
}
```

The TripleBot class will be made if the player requires three bots in their game.

8 BotManager

Author: JavaComSci
Description: TODO

9 FrontendTests

Author: Steven Dellamore, Richard Hansen
Description: TODO
